

Group Submission Human Authored Synthesis (Insufficient example)

Question

How do we import the Airbnb dataset and clean it

Synthesis

We used AI to learn how to import a messy dataset. AI said to use `readr read_csv` to import the file. AI also said to use `na c("", "NA", "N/A")` to handle missing values. AI said to use `lubridate` for dates and to check the data using `glimpse` and `summary`.

We followed these steps. After importing, we looked at `summary`. We think the data looks fine. If there are missing values, we can remove them. If dates are not correct, we can convert them. If prices have dollar signs, we can remove the dollar sign and then make it numeric.

Conclusion

Importing data is important and we should check missing values and types.

Why this fails the requirements

1. It repeats AI phrasing and reads like AI text copied into the writeup
2. It does not identify two hidden assumptions with evidence
3. It provides no counts, no column examples, no parsing failure summary
4. It does not discuss limitations or risks in a meaningful way
5. It does not provide a concrete import and validation routine tied to this dataset
